Silver Staining Method Compatible with Mass Spectrometry

Equipment

shaker table
dedicated trays for silver staining

Solutions

Use the highest grade of chemicals/reagents available for all steps. Prepare Sensitizer, Silver and Developer reagents fresh every time.

Fix 1: 50% methanol/10% acetic acid
Fix 2: 5% methanol/1% acetic acid
Fix 3: 50% methanol
Stop: 6% acetic acid or 40 mM Na2-EDTA

SENSITIZER: 0.02% sodium thiosulfate
20 mg Na2S2O3•5H2O + 100 ml ddH2O

Reserve a small volume of Sensitizer (2.0 mL) for Developer solution.

SILVER: 0.2% silver nitrate
200 mg AgNO3 + 100 ml ddH2O  Keep at 4ºC until used

DEVELOPER: sodium carbonate/sodium thiosulfate/formaldehyde
6.0 g NaCO3 + 50 μl (37% stock) formaldehyde + 2ml Sensitizer (0.02% Na2S2O3•5H2O) + 100 ml ddH2O (it may take a moment for the Na2CO3 to dissolve)

Method

Begin protocol immediately following electrophoresis

Following incubation, SILVER must be discarded in hazardous waste container designated for metals. DO NOT discard in sink.

1. Incubate gel in Fix 1 for 30 min with shaking.
2. Incubate gel in Fix 2 for 15 min with shaking.
3. Rinse gel in Fix 3 for 1 min (optional, use for larger gels, 18 –24cm).
4. Wash gel in ddH2O with shaking, at least 3 x 10 min. Staining is best if wash in ddH2O is extended, e.g. overnight.
5. Sensitize exactly 90 sec in SENSITIZER solution, with shaking.
6. Rinse gel in ddH₂O 3 x 30 seconds.
7. Incubate gel in chilled SILVER solution for a minimum of 30 min, with shaking. Gel can be left in SILVER solution for extended periods (e.g., overnight).
8. Remove SILVER solution from gel and discard in appropriate hazardous waste container.
9. Rinse gel 3 x 1min **Absolute Maximum**
10. Incubate in DEVELOPER solution, with shaking. Protein stain will become visible within 1-5 minutes, depending upon the total protein concentration; develop gel to desired intensity.
11. Stop with 100 mL 6% acetic acid or 40 mM Na₂-EDTA, shake for 5 min.
12. Wash gel in ddH₂O. Store stained gel in ddH₂O at 4ºC.
13. Cut out and destain bands ASAP after staining the gel, follow the silver destaining protocol.

### Destaining Silver Stained Gel Bands Prior to Protease Digestion

**Stock solutions**

Use the highest grade of chemicals and water available.

60 mM potassium ferricyanide
198 mg potassium ferricyanide + 10 ml H₂O
This solution can be stored in a amber colored glass or plastic bottle for several months.
Mix 1:1 with the 200 mM sodium thiosulfate solution only when ready to destain bands/spots.

200 mM sodium thiosulfate
316 mg sodium thiosulfate + 10 ml H₂O
This solution can be stored in a clear colored glass or plastic bottle for several months.
Mix 1:1 with the 60 mM potassium ferricyanide solution only when ready to destain bands/spots.

**Method**

1. Destain the band using 30 mM potassium ferricyanide/100 mM sodium thiosulfate solution until the brown color disappears. Use sufficient solution to cover the band. The solution may need to be changed if it takes longer than 5 minutes to destain. **DO NOT** let the band sit in this solution too long.
2. Remove the destain solution and wash the band for 5-10 minutes at least 5 times with H₂O, the solution should be clear.
3. If the sample will not be digested right away store in water or freeze the gel band.
